DEEWR MONTHLY LEADING INDICATOR OF EMPLOYMENT

JUNE 2008

RESULTS

DEEWR’s Monthly Leading Indicator of Employment (Indicator) has *fallen* for five consecutive months, which is an unchanged pattern of results from that reported last month. There were substantial data revisions to the Indicator’s component series, in particular the Westpac-Melbourne Institute Leading Index of Economic Activity (with a weighting of 24.1 per cent) which contributed to the revision in the Indicator series. As a result, it is still too early to confirm a slowing in the pace of employment growth below its long-term trend of 2.5 per cent per annum (because the Indicator has been falling for fewer than six consecutive months) although the downward trajectory of the Indicator has become even more pronounced in recent months.

Levels of the DEEWR Leading Indicator of Employment and Cyclical Employment

VALUE OF THE LEADING INDICATOR OVER THE PAST SIX MONTHS*

	Jan-08	Feb-08	Mar-08	Apr-08	May-08	Jun-08
Leading Indicator	0.533	0.477	0.387	0.282	0.155	-0.010

*standard deviations from the cyclical trend

COMPONENTS OF THE LEADING INDICATOR (SEASONALLY ADJUSTED)*

Series	Percentage Change over the Year	Percentage Change over the Quarter	Percentage Change over the Month	Weights (%)
ANZ Newspaper Job Ads (May 2008)	-16.0%	-10.1%	-13.5%	44.3
Dun and Bradstreet Employment Expectations (% pt change) (Year to September Quarter 2007 - Jun 2008 release)	7.0 %pts	8.0 %pts	-2.0 %pts	22.4
Westpac-Melbourne Institute Leading Index of Economic Activity (March 2008)	4.3%	-0.1%	0.2%	24.1
Westpac-Melbourne Institute Consumer Sentiment Index (May 2008)	-27.6%	-7.8%	2.7%	9.2

*Note: The cyclical components of each series, and not the monthly seasonally adjusted percentage changes shown above, contribute to the movements in the Leading Indicator.

TECHNICAL NOTES

The DEEWR Leading Indicator of Employment is the average of the normalised and standardised cyclical elements of four series which have been shown to lead cyclical employment consistently over a long period.

The Leading Indicator is designed to give advance warning of turning points in “cyclical employment” (i.e. the deviation of the one-year trended smoothed rate of employment growth from its six-year long-term trend). The average lead time of the Indicator (i.e. the time between a peak or trough in the Indicator and the corresponding peak or trough in cyclical employment) is around nine months (or about twelve months if account is taken of the additional 12-month lag in the Dun and Bradstreet Employment Expectations Index), although it has varied over the past decade. A ‘turning point’ in the Indicator is said to be confirmed when there are six consecutive monthly movements in the same direction after the turning point. A fall (or rise) in the Indicator does not necessarily mean that the level of employment will subsequently fall (or rise). Rather, it implies that after a lag, the growth rate of employment may fall below (or rise above) its trend rate of about 2.5 per cent a year. The DEEWR Leading Indicator incorporates data lagged one year for the Dun and Bradstreet Employment Expectations series and the most up to date data for other series. This is based on econometric testing which revealed that the Dun and Bradstreet series had a longer lag. The name of the issue of the DEEWR Leading Indicator of Employment, and the labels for the x-axis of the chart, relate to the month the Indicator is released. The data used to derive the cyclical employment chart line, however, are two months behind the Indicator release month.

RELEASE DETAILS

The DEEWR Leading Indicator is available on the Internet at approximately 2pm on the day of its release. The next issue of the DEEWR Leading Indicator is due for release on Wednesday 9 July 2008.
